The Third Russian Finnish Symposium on Discrete  
Mathematics, 2014

- 1 Motivation
- 2 Integer Weighted Büchi Automata
- 3 Robot Games with states
- 4 Further Considerations

Let  $A = \{a_1, \dots, a_j, \dots, a_{m-1}\}$  be a finite alphabet.

- $A^*$  consists of all finite words over  $A$ .
- $A^\omega$  consists of all infinite words over  $A$ .

Let  $A = \{a_1, \dots, a_j, \dots, a_{m-1}\}$  be a finite alphabet and  $w \in A^*$ .

- $A^*$  consists of all finite words over  $A$ .
- $A^\omega$  consists of all infinite words over  $A$ .
- $w(i)$  is  $i$ th letter of  $w$ .
- Let  $a$  be a letter.  $aA^* = \{aw \mid w \in A^*\}$ .

Let  $A = \{a_1, \dots, a_j, \dots, a_{m-1}\}$  be a finite alphabet and  $w \in A^*$ .

- $A^*$  consists of all finite words over  $A$ .
- $A^\omega$  consists of all infinite words over  $A$ .
- $w(i)$  is  $i$ th letter of  $w$ .
- Let  $a$  be a letter.  $aA^* = \{aw \mid w \in A^*\}$ .
- $u \leq w$  if  $w = uv$  for some  $v \in A^*$ .
- $u < w$  if  $w = uv$  for some non-empty  $v \in A^*$

Let  $A = \{a_1, \dots, a_j, \dots, a_{m-1}\}$  be a finite alphabet and  $w \in A^*$ .

- $A^*$  consists of all finite words over  $A$ .
- $A^\omega$  consists of all infinite words over  $A$ .
- $w(i)$  is  $i$ th letter of  $w$ .
- Let  $a$  be a letter.  $aA^* = \{aw \mid w \in A^*\}$ .
- $u \leq w$  if  $w = uv$  for some  $v \in A^*$ .
- $u < w$  if  $w = uv$  for some non-empty  $v \in A^*$ .
- Similarly defined when  $w \in A^\omega$ .

- For given Finite Automaton  $\mathcal{A}$ , over alphabet  $A$ , is its language  $L(\mathcal{A}) = A^*$ ?
- For given Büchi Automaton  $\mathcal{B}$ , over alphabet  $A$ , is its language  $L(\mathcal{B}) = A^\omega$ ?

- For given Finite Automaton  $\mathcal{A}$ , over alphabet  $A$ , is its language  $L(\mathcal{A}) = A^*$ ?
- For given Büchi Automaton  $\mathcal{B}$ , over alphabet  $A$ , is its language  $L(\mathcal{B}) = A^\omega$ ?
- Both are known to be decidable.

- Extend automaton by adding *weight function*  $\gamma$  to transitions.
- For given Weighted Automaton  $\mathcal{A}^\gamma$ , over alphabet  $A$ , is its language  $L(\mathcal{A}^\gamma) = A^*$ ?

- Extend automaton by adding *weight function*  $\gamma$  to transitions.
- For given Weighted Automaton  $\mathcal{A}^\gamma$ , over alphabet  $A$ , is its language  $L(\mathcal{A}^\gamma) = A^*$ ?
- Shown to be undecidable by Halava and Harju in 1999.

- Let  $\mathcal{A} = (Q, A, \delta, q_0)$  be a finite automaton, where  $Q$  is set of states,  $A$  is alphabet,  $\delta$  is transition function, and  $q_0$  is initial state.

- Let  $\mathcal{A} = (Q, A, \delta, q_0)$  be a finite automaton, where  $Q$  is set of states,  $A$  is alphabet,  $\delta$  is transition function, and  $q_0$  is initial state.
- Instead of  $\delta$ , consider  $\sigma$ , which is a mapping of edges  $T$  to transitions.
- Let  $\gamma : T \rightarrow \mathbb{Z}$  be the weight function that assigns weights to edges.

- Let  $\mathcal{A} = (Q, A, \delta, q_0)$  be a finite automaton, where  $Q$  is set of states,  $A$  is alphabet,  $\delta$  is transition function, and  $q_0$  is initial state.
- Instead of  $\delta$ , consider  $\sigma$ , which is a mapping of edges  $T$  to transitions.
- Let  $\gamma : T \rightarrow \mathbb{Z}$  be the weight function that assigns weights to edges.
- Let  $w$  be an infinite word. It is accepted by  $\mathcal{A}^\gamma$  if there exists a computation  $\pi$  such that infinite number of its prefixes  $p$  have zero weight.

- We use undecidability of *Infinite Post Correspondence Problem* ( $\omega$ PCP) for our proof.

- We use undecidability of *Infinite Post Correspondence Problem* ( $\omega$ PCP) for our proof.
- In  $\omega$ PCP we are given two morphisms  $h, g : A^* \rightarrow B^*$ .
- Does there exist an infinite word  $w$  such that for all prefixes  $p$  either  $h(p) < g(p)$  or  $g(p) < h(p)$ ?

- We use undecidability of *Infinite Post Correspondence Problem* ( $\omega$ PCP) for our proof.
- In  $\omega$ PCP we are given two morphisms  $h, g : A^* \rightarrow B^*$ .
- Does there exist an infinite word  $w$  such that for all prefixes  $p$  either  $h(p) < g(p)$  or  $g(p) < h(p)$ ?
- Shown to be undecidable by Halava and Harju for domain alphabets  $|A| \geq 9$  and improved to  $|A| \geq 8$  by Dong and Liu.

- The idea of the proof of  $\omega$ PCP is to simulate a semi-Thue system with undecidable termination problem.

- The idea of the proof of  $\omega$ PCP is to simulate a semi-Thue system with undecidable termination problem.
- The solutions are of specific form:
  - 1 The first letter is  $d$  that contains the input of semi-Thue system.
  - 2 An infinite sequence of configurations separated by special symbols  $\#$ .

- The idea of the proof of  $\omega$ PCP is to simulate a semi-Thue system with undecidable termination problem.
- The solutions are of specific form:
  - 1 The first letter is  $d$  that contains the input of semi-Thue system.
  - 2 An infinite sequence of configurations separated by special symbols  $\#$ .
  - 3 Let  $p$  be a prefix of a solution, then  $|g(p)| < |h(p)|$ .
  - 4 “Image under  $h$  is ahead of image under  $g$  by one configuration”.

- The goal is to construct an automaton  $\mathcal{A}^\gamma$  such that  $L(\mathcal{A}^\gamma) = A^\omega$  if and only if the instance of  $\omega$ PCP has no solution.

- The goal is to construct an automaton  $\mathcal{A}^\gamma$  such that  $L(\mathcal{A}^\gamma) = A^\omega$  if and only if the instance of  $\omega$ PCP has no solution.
- An infinite word  $w \in dA^\omega$  is accepted by  $\mathcal{A}^\gamma$  if and only if for some finite prefix  $p$  of  $w$ ,  $g(p) \not\leq h(p)$ . Such a prefix  $p$  does exist for all infinite words except for the solutions of the instance  $(h, g)$ . We call the verification of such a prefix  $p$  *error checking*.
- All infinite words beginning with letter in  $A \setminus \{d\}$  are accepted by  $\mathcal{A}^\gamma$ .

First for each  $a \in A$ , let

$$\langle q_0, a, q_0, m(|h(a)| - |g(a)|) \rangle, \quad \langle q_1, a, q_1, m(-|g(a)|) \rangle, \quad \langle q_2, a, q_2, 0 \rangle$$

be in  $\sigma$ , and for all  $b \in A \setminus \{d\}$ , let

$$\langle q_0, b, q_2, 0 \rangle \in \sigma.$$

For error checking we need the following transitions for all letters  $a \in A$ : Let  $h(a) = b_{j_1} b_{j_2} \cdots b_{j_{n_1}}$ , where  $b_{j_i} \in B$ , for each index  $1 \leq k \leq n_1$ . Then let, for each  $k = 1, \dots, n_1$ ,

$$\langle q_0, a, q_1, m(k - |g(a)|) + j_k \rangle \in \sigma \quad (1)$$

Let  $g(a) = b_{i_1} b_{i_2} \cdots b_{i_{n_2}}$ , where  $b_{i_\ell} \in B$ , for each index  $1 \leq \ell \leq n_2$ . For each  $\ell = 1, \dots, n_2$  and letter  $b_c \in B$  such that  $b_{i_\ell} \neq b_c \in B$ , let

$$\langle q_1, a, q_2, -m\ell - c \rangle \in \sigma. \quad (2)$$

**Figure:** The weighted automaton  $\mathcal{A}^\gamma$ . In the figure  $a \in A, b \in A \setminus \{d\}$  and  $|A| = m - 1$ .

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$p(1)$   
 $h$ : \_\_\_\_\_  
 $g$ : \_  
 $\gamma$ :  $(\text{_____})m$

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$p(1)p(2)$   
 $h$ :   
 $g$ :   
 $\gamma$ : 

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$$\begin{aligned}
 & p(1) \cdots p(t-1) \\
 h: & \quad \underline{\hspace{1cm}} \cdots \underline{\hspace{1cm}} \\
 g: & \quad \underline{\hspace{1cm}} \cdots \underline{\hspace{1cm}} \\
 \gamma: & \quad (\underline{\hspace{1cm}})m
 \end{aligned}$$

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$$p(1) \cdots p(t-1)p(t)$$

$$h: \underline{\hspace{2cm}} \cdots \underline{\hspace{2cm}} \underline{b_{j_k}}$$

$$g : \quad \boxed{\phantom{0}} \cdots \boxed{\phantom{0}} \text{---} \boxed{\phantom{0}}$$

$$\gamma: \quad (\underline{\hspace{1.5cm}})m + j_k$$

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$$\begin{aligned}
 & p(1) \cdots p(t-1)p(t)p(t+1) \\
 h: & \text{---} \cdots \text{---} b_{j_k} \text{---} \text{---} \\
 g: & \text{---} \cdots \text{---} \text{---} \text{---} \\
 \gamma: & (\text{---})m + j_k
 \end{aligned}$$

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$$\begin{array}{l}
 p(1) \cdots p(t-1)p(t)p(t+1)p(t+2) \\
 h: \text{---} \cdots \text{---} b_{j_k} \text{---} \text{---} \\
 g: \text{---} \cdots \text{---} \text{---} \text{---} \\
 \gamma: (\text{---})m + j_k
 \end{array}$$

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$$\begin{aligned}
 & p(1) \cdots p(t-1)p(t)p(t+1) \cdots p(n-1) \\
 h: & \text{---} \cdots \text{---} \text{---} b_{j_k} \text{---} \cdots \text{---} \\
 g: & \text{---} \cdots \text{---} \text{---} \text{---} \cdots \text{---} \\
 \gamma: & (\sqcup)m + j_k
 \end{aligned}$$

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$$p(1) \cdots p(t-1)p(t)p(t+1) \cdots p(n-1)p(n)$$

$h$ : 

$g$ : 

$\gamma$ : 0

## Example

Let  $dw$  be an infinite word that is not a solution for  $\omega$ PCP and let  $p$  be its prefix such that for some index  $r$   $h(p)(r) \neq g(p)(r)$ .

$$\begin{array}{l}
 p(1) \cdots p(t-1)p(t)p(t+1) \cdots p(n-1)p(n)p(n+1) \\
 h: \text{---} \cdots \text{---} b_{j_k} \text{---} \cdots \text{---} \\
 g: \text{---} \cdots \text{---} b_{\ell} \text{---} \\
 \gamma: 0
 \end{array}$$

## Theorem

*It is undecidable whether or not  $L(\mathcal{A}^\gamma) = A^\omega$  holds for 3-state integer weighted Büchi automata  $\mathcal{A}^\gamma$  over its alphabet  $A$ .*

## Theorem

*It is undecidable whether or not  $L(\mathcal{A}^\gamma) = A^\omega$  holds for 3-state integer weighted Büchi automata  $\mathcal{A}^\gamma$  over its alphabet  $A$ .*

## Corollary

*It is undecidable whether or not  $L(\mathcal{B}^\gamma) = A^\omega$  holds for 3-state integer weighted Büchi automata  $\mathcal{B}^\gamma$ , where each state is final, over its alphabet  $A$ .*

- Robot Game with states is a two-player vector addition game on integer lattice  $\mathbb{Z}^n$ .
- From initial point  $\mathbf{x}_0$ , *Attacker* tries to reach the origin, while *Defender* tries to keep the game from reaching the origin.

- Robot Game with states is a two-player vector addition game on integer lattice  $\mathbb{Z}^n$ .
- From initial point  $\mathbf{x}_0$ , *Attacker* tries to reach the origin, while *Defender* tries to keep the game from reaching the origin.
- Vectors players can play are dependant on the state of the underlying automaton.
- The decision problem is whether there exists a winning strategy for Attacker. That is, can Attacker win, regardless of the vectors Defender plays.

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5 \rightarrow 1$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5 \rightarrow 1 \rightarrow 4$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5 \rightarrow 1 \rightarrow 4 \rightarrow 0$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5 \rightarrow 1$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5 \rightarrow 1 \rightarrow -1$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5 \rightarrow 1 \rightarrow -1 \rightarrow 2$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5 \rightarrow 1 \rightarrow -1 \rightarrow 2 \rightarrow 3$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 5 \rightarrow 1 \rightarrow -1 \rightarrow 2 \rightarrow 3 \rightarrow 0$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

2

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 0$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 0 \rightarrow -4$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 0 \rightarrow -4 \rightarrow -3$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 0 \rightarrow -4 \rightarrow -3 \rightarrow 0$$

## Example

Consider one-dimensional game with initial point  $x_0 = 2$ .

$$2 \rightarrow 0 \rightarrow -4 \rightarrow -3 \rightarrow 0$$

$\therefore$  Attacker has a winning strategy.

- We construct a Robot Game with states where Attacker has a winning strategy if and only if the underlying automaton is universal.

**Figure:** The picture of the weighted automata  $\mathcal{B}$  and  $\mathcal{A}$  with vectors substituting the transitions. In the figure  $a_i \in A$ .

- The idea is that Defender gives letters in second component of the vector and Attacker has to match the letter as well as modify first component according to the automaton.

- The idea is that Defender gives letters in second component of the vector and Attacker has to match the letter as well as modify first component according to the automaton.
- If Attacker does not match the letter, Defender wins using the special move.

- The idea is that Defender gives letters in second component of the vector and Attacker has to match the letter as well as modify first component according to the automaton.
- If Attacker does not match the letter, Defender wins using the special move.
- If Defender abuses the special move, Attacker wins by going to new checking state.

- The idea is that Defender gives letters in second component of the vector and Attacker has to match the letter as well as modify first component according to the automaton.
- If Attacker does not match the letter, Defender wins using the special move.
- If Defender abuses the special move, Attacker wins by going to new checking state.
- If Attacker abuses the checking state, Defender wins.

- The idea is that Defender gives letters in second component of the vector and Attacker has to match the letter as well as modify first component according to the automaton.
- If Attacker does not match the letter, Defender wins using the special move.
- If Defender abuses the special move, Attacker wins by going to new checking state.
- If Attacker abuses the checking state, Defender wins.
- If the word played by Defender is not accepted by the automaton, the first component will never be 0.

- The idea is that Defender gives letters in second component of the vector and Attacker has to match the letter as well as modify first component according to the automaton.
- If Attacker does not match the letter, Defender wins using the special move.
- If Defender abuses the special move, Attacker wins by going to new checking state.
- If Attacker abuses the checking state, Defender wins.
- If the word played by Defender is a solution of  $\omega$ PCP, first component will never be 0.

## Theorem

*It is undecidable whether Attacker has a winning strategy in 2-dimensional Robot Game with states.*

## Theorem

*It is undecidable whether Attacker has a winning strategy in 2-dimensional Robot Game with states.*

Note that, while number of states is small for both players, for Defender number of edges is also small but for Attacker there are millions of edges.

- Universality Problem for 2-state integer weighted Büchi automata.
- An upper bound on number of edges in Robot Games with states.
- Application to similar Defender-Attacker games.

THANK YOU!
